

Rockstone and Blackstone graphite properties are presently NI 43-101 non-compliant; however, a technical report will be prepared expeditiously. At this time, there is no resource definition or average grade determination for graphite discoveries made on either property. Exploration data and analytical results displayed on this website are both historic and preliminary in nature, consequently unverified and therefore should not be relied upon. True drill intersection widths have not yet been determined for mineralization encountered in historic diamond drill hole intersections. Mineralization encountered may not be economically extractable due to unforeseen metallurgical issues or unanticipated impurities which may impact economic development. First Nations groups must be consulted during exploration and future production. Archaeological sites and environmental constraints may inhibit exploration and future mineral production. Historically-reported laboratory analyses and diamond drill intersection results may be inaccurate or misinterpreted.
